

When it comes to weight loss in overweight and obese adults with knee osteoarthritis, more is better

June 18 2018

Researchers previously showed that overweight and obese individuals with knee osteoarthritis can reduce pain by 50% and significantly improve function and mobility with a 10% or more weight loss over an 18-month period. The investigators' latest findings, which are published in *Arthritis Care & Research*, reveal that a 20% or more weight loss has the added benefit of continued improvement in physical health-related quality of life along with an additional 25% reduction in pain and improvement in function.

The results come from a secondary analysis of diet-only and diet plus exercise groups in the Intensive Diet and Exercise for Arthritis (IDEA) [randomized controlled trial](#). A total of 240 overweight and obese older community-dwelling adults with pain and knee osteoarthritis were divided into four groups according to [weight loss](#) achieved over an 18-month period: less than 5% (
