Too much salt is not good for your health. This is especially true for people who have high blood pressure. Cutting back on how much you reach for the saltshaker is a good start. Dr. Regis Fernandes, a Mayo Clinic cardiologist, says beware of other places salt may be hiding.

Most Americans eat too much salt, that's according to the Centers for Disease Control and Prevention. Not good, says Dr. Fernandes, when you consider what salt does to your body.

"Salt increases our blood pressure, and [high blood pressure](#) is associated with higher cardiovascular risk," says Dr. Fernandes.

He says most Americans consume 3,400 milligrams of salt a day, while the recommended amount is 2,300, the equivalent of 1 teaspoon. It's even lower at 1,500 if you have high blood pressure. And Dr. Fernandes warns most sodium intake doesn't come from the saltshaker.

"Most of the salt we get is from processed foods, from sauces and restaurants and things like that, eating out," Dr. Fernandes says.

Dr. Fernandes says even the slightest drop in salt intake can help lower your [blood pressure](#) and improve heart health. He recommends gradually cutting back on salt and always checking food labels.
