

US adults want physicians managing their health care

December 24 2013

(HealthDay)—U.S. adults prefer physicians to non-physicians for health care and would choose a physician to lead their medical team, according to the results of a survey commissioned by the American Academy of Family Physicians (AAFP).

A total of 1,320 U.S. adults aged 18 years or older were surveyed online about a series of health care topics, including who they most often see for health care, who they would prefer to see, and what characteristics they attribute to [health care professionals](#).

According to the survey, with regard to health care, 72 percent of adults prefer physicians to non-physicians. Given a choice, 90 percent of U.S. adults would choose a physician to lead their medical team. Compared

with non-physicians, adults see physicians and family physicians as more knowledgeable, experienced, trusted, and up-to-date on medical advances. When a medical question arises, 41 percent indicated that they would confer with their primary care physician, 24 percent a physician, 8 percent a specialist, 6 percent a nurse practitioner, and 3 percent a physician assistant.

"This survey puts a face—a [family physician](#) face—on the message that's being repeated nationwide that team-based care and primary care are critical to the successful transformation of [health care](#) delivery in this country," AAFP president Reid Blackwelder, M.D., said in a statement.
