(HealthDay)—Patients with musculoskeletal conditions who are using prescribed opioids are more likely to be highly satisfied with their care, according to a study published in the January/February issue of the *Annals of Family Medicine*.

Brian D. Sites, M.D., from the University of Pennsylvania in Philadelphia, and colleagues used data from the 2008 to 2014 Medical Expenditure Panel Survey to assess whether prescription opioid use is associated with satisfaction with care among 19,566 U.S. adults who had musculoskeletal conditions.

The researchers found that 13.1 percent of patients with musculoskeletal conditions were [opioid users](#), defined as receiving at least one prescription in two six-month time periods. Opioid users were more likely to report high satisfaction with care (odds ratio, 1.32), compared to nonusers when adjusting for sociodemographic characteristics and health status. A stronger
