

The global prevalence of erectile dysfunction

July 3 2019

A review of published studies found that estimates for the global prevalence of erectile dysfunction vary widely, ranging from 3% to 76.5%. The findings are published in *BJU International*.

The variation may reflect differences in study population ages and different definitions and assessment methods of erectile dysfunction.

Erectile dysfunction was linked with increased risks of cardiovascular disease, dementia, and [early death](#).

The authors noted that early detection of erectile dysfunction may help improve quality of life in affected men, and also indicate when interventions may be warranted to prevent [cardiovascular disease](#) and early death. "Due to the sensitive nature of the topic, physicians should consider screening for [erectile dysfunction](#) in at-risk patients, as information may not be volunteered," they wrote.
