

Telehealth disparity seen in cancer care

14 October 2020

(HealthDay)—Black and Hispanic patients with cancer used telehealth less often than White patients during the COVID-19 pandemic in New York City, according to a study presented at the ASCO Quality Care Symposium, held virtually from Oct. 9 to 10.

Cardinale B. Smith, M.D., Ph.D., and Aarti Sonia Bhardwaj, M.D., from the Icahn School of Medicine at Mount Sinai in New York City, evaluated the differences in telehealth use among minorities and nonminorities with cancer. Electronic medical record data were collected for [cancer patients](#) seen at a National Cancer Institute designated [cancer center](#) and eight associated ambulatory sites across New York City from March 1 to June 1, 2020.

The researchers identified 7,681 telehealth visits during the study period; 76 percent of these telehealth visits were video visits. For comparison, in 2019,
